

Etheron Terminal

Etheron terminal provides fully integrated API emulation for Orb-Weaver based smart card, it is equipped with 3.2 inch LCD and touchscreen for human interface, USB port for communication with PC software, designated IO port for external device control.

Cloud integration are already provided to manage the terminal framework remotely, this kind of mechanism eliminate the need to update each terminal software manually, as well as managing each terminal remotely through our cloud service.

It also support integration with 3rd party devices, enabling integration between service and hardware, the use of Wi-Fi internet network instead of telecommunication network would eliminate unnecessary operational cost while deliver the most sophisticated security.

Features

- 168Mhz ARM Cortex microprocessor with 192K RAM
- 3.2 inch, 64K colors LCD with touchscreen interface
- ISO7816-3 interface with T=0 and T=1 protocol
- ISO14443-A interface up to 104kbps
- IEEE802.11b/g/n max 66Mbps
- USB Full Speed communication for transaction control
- 3 Pin IO port with (1x UART, 3x IO port, 3x PWM port)
- Up to 36 hours operational time (2600mAh)
- Integrated real-time operating system with task monitoring
- Cloud integration, auto-sync terminal framework and application management
- Global Platform v2.2 for card application management
- Transaction automation through automaton, cloud integration, auto-sync NTP, firmware update
- Up to 64K user space application framework
- Changable screen orientation

External Interfaces

USB port

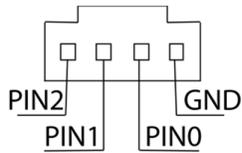

USB port can be connected to PC or external adapter (in-case of charging), use at minimum 500mA adapter for charging. USB also can be used to provide access to host computer, allowing transaction to be triggered from host computer, in-order to enable computer access, the host computer must install the specified driver.

[Download Driver](#)

IO Port

IO port consist of three pin, each pin can be configured differently depending on the installed framework. External device can be interfaced through IO port

Pin	Ext	Type	PWM (freq)
0	Rx	IO/Int/UART	10-1000Hz
1	Tx	IO/Int/UART	10-1000Hz
2	-	IO/Int	10-1000Hz

Electrical Characteristics

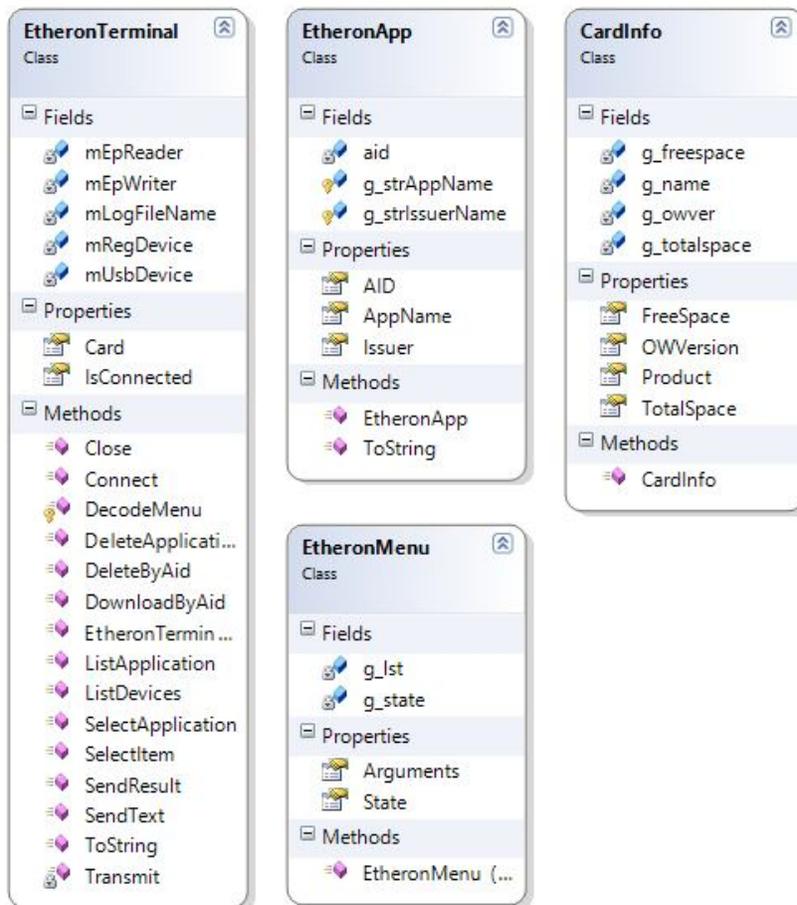

Name	Desc	Min	Typical	Max	Unit
Vusb	USB Input Voltage	4.5	5.0	5.5	V
Vin	Logic Voltage	3	3.3	3.6	V
Vout	Logic Voltage	3	3.3	3.6	V
Iusb	USB Input Current	0	400	480	mA
Istb	Standby Current	50	65	70	mA
Irun	Running Current	170	250	300	mA
Tr	Running Temperature	5	27	70	C

Installing Ethern Driver

Download Ethern Interface Driver zip file from www.orbleaf.com (same way as **Organ Studio > Connecting with Ethern Terminal**), extract to directory any directory and execute the installer (depending on your system, an x86 for 32 bit or x64 for 64 bit operating system), the driver already tested to works with Microsoft Windows 8.1 (you might need to disable device driver enforcement check if necessary), once the driver installed, you can start connecting any Ethern Terminal.

Accessing Ethern Terminal

Before accessing Ethern Terminal, you must install the driver first, a library for accessing Ethern Terminal already available as Organ Studio Module, simply go to modules directory of Organ Studio installation and find EthernNet.dll, you can start accessing any Ethern Terminal using Microsoft Visual Studio, EthernNet and Ethern driver are based on LibUSB project.

Using Microsoft Visual Studio To Access Ethern Terminal

EthernTerminal.ListDevices()

use static method ListDevices() from EthernTerminal class to list all connected Ethern Terminal, ListDevice() would return all available devices in array of EthernTerminal, use connect method on each EthernTerminal instance to start connecting.

ListApplication()

after the terminal has been successfully connected, use ListApplication() method to list available card application on terminal (the card must be inserted first), once all application has been listed, you can start selecting application through SelectApplication() method.

```
Ethern_Sample.EthernAccess
devLstCbBox_SelectedIndexChanged(object sender, EventArgs e)

}

private void EthernAccess_Load(object sender, EventArgs e)
{
    devLstCbBox.Items.AddRange(EthernTerminal.ListDevices());
}

private void devLstCbBox_SelectedIndexChanged(object sender, EventArgs e)
{
    try
    {
        g_etDevList = (EthernTerminal)devLstCbBox.Items[devLstCbBox.SelectedIndex]
        if (g_etDevList.Connect())
        {
            devLstCbBox.Enabled = false;
            conBtn.Enabled = true;
            conBtn.Text = "Disconnect";
            EthernApp[] apps = g_etDevList.ListApplication();
            itemLsBox.Items.Clear();
            itemLsBox.Items.AddRange(apps);
        }
    }
    catch { }
}

private void conBtn_Click(object sender, EventArgs e)
{
}
```
